Hi Michal,

I was now able to review the x rays.

Not a case for partial nephrectomy!
This is a serious tumor that needs to be taken seriously! I would now treat it as a T3a disease , based on my personal experience with over 5000 similar patients!!

While I will be able to TECHNICALLY perform a partial Nx, this is not justified! The tumor is larger than 7 cm , has suspicious areas in the perinephric fat , and it might be beyond Gerota's fascia.
Since you have only a single opportunity to surgically intervene , the prudent CANCER operation is to widely excise the tumor with safety margins. It will also allow for examining the regional lymph nodes.

An extensive radical Nx is therefore the best chance to control the disease.

Let me know if you want to further discuss management.

Arie
